Weekly signal brief: Galle RDHS

As of reporting week 2026-W33 (ending 16 Aug 2026) (WER Vol 53 No 34, 2026-W33). The WER is published with a lag of about two months, so this describes weeks already past.

Unusual this week

Viral hepatitis 3 cases, expected about 0 (range up to 2), 99.9th percentile (WER Vol 53 No 34, 2026-W33)

Early warnings

Chickenpox 42 cases, above its recent level of about 17 (range up to 31) but not yet beyond the seasonal range (WER Vol 53 No 34, 2026-W33)

Held back

none (reporting completeness is within this district's usual range).

Persistent

no signal has lasted two weeks or more.

Outlook

Leptospirosis: chance of an elevated week 14% this week (2026-W42) and 13% next week (2026-W43; elevated here means 26 cases or more), from a regression model with recent counts, season and rainfall; expected about 20 cases this week (90% range 9 to 32) (WER Vol 53 No 34, 2026-W33); Dengue: chance of an elevated week 0% this week (2026-W42) and 0% next week (2026-W43; elevated here means 101 cases or more), from the usual pattern for this time of year (seasonal climatology); expected about 85 cases this week (90% range 0 to 989; very wide because recent forecasts missed often) (WER Vol 53 No 34, 2026-W33)

Data note

reporting completeness (C**) 100% (WER Vol 53 No 34, 2026-W33), this district's usual low is 99%. No earlier week was revised in this issue.

Population-level signals for planning and investigation only. No diagnosis, treatment or prophylaxis advice. Every signal is a prompt for investigation, relative to this district's own history; counts are under-notified.
